patch and vulnerability management is a security practice designed to proactively prevent the exploitation of it vulnerabilities that exist within an organization the expected result is to reduce the time and money spent dealing with vulnerabilities and exploitation of those vulnerabilities proactively managing vulnerabilities of systems will reduce or eliminate the potential for exploitation and involve considerably less time and effort than responding after an exploitation has occurred patches are additional pieces of code developed to address problems commonly called bugs in software patches enable additional functionality or address security flaws within a program vulnerabilities are flaws that can be exploited by a malicious entity to gain greater access or privileges than it is authorized to have on a computer system not all vulnerabilities have related patches thus system administrators must not only be aware of applicable vulnerabilities and available patches but also other methods of remediation e g device or network configuration changes employee training that limit the exposure of systems to vulnerabilities this document provides guidance on creating a security patch and vulnerability management program and testing the effectiveness of that program the primary audience is security managers who are responsible for designing and implementing the program however this document also contains information useful to system administrators and operations personnel who are responsible for applying patches and deploying solutions i e information related to testing patches and enterprise patching software timely patching of security issues is generally recognized as critical to maintaining the operational availability confidentiality and integrity of information technology it systems however failure to keep operating system and application software patched is one of the most common issues identified by security and it professionals new patches are released daily and it is often difficult for even experienced system administrators to keep abreast of all the new patches and ensure proper deployment in a timely manner most major attacks in the past few years have targeted known vulnerabilities for which patches existed before the outbreaks indeed the moment a patch is released attackers make a concerted effort to reverse engineer the patch swiftly measured in days or even hours identify the vulnerability and develop and release exploit code

thus the time immediately after the release of a patch is ironically a particularly vulnerable moment for most organizations due to the time lag in obtaining testing and deploying a patch to help address this growing problem it is recommended that all organizations have a systematic accountable and documented process for managing exposure to vulnerabilities through the timely deployment of patches this document describes the principles and methodologies organizations can use to accomplish this organizations should be aware that applying patches and mitigating vulnerabilities is not a straightforward process even in organizations that utilize a formal patch and vulnerability management process to help with the operational issues related to patch application this document covers areas such as prioritizing obtaining testing and applying patches it also discusses testing the effectiveness of the patching program and suggests a variety of metrics for that purpose nist recommends that federal agencies implement the following recommendations to assist in patch and vulnerability management personnel responsible for these duties should read the corresponding sections of the document to ensure they have an adequate understanding of important related issues
